DESIGN NOTE

For Class C power-amplifier designs, small-signal parameters are not applicable. The parallel equivalent output capacitance and input resistance and capacitance for Class C power-amplifier design are used.

The parallel resistive portion of the collector load impedance for a power amplifier, R_L', may be computed by assuming a peak voltage swing equal to V_{CC}, and using the expression $R_L' = V_{CC}^2/2P$ where P = RF power output. The computed R_L' may then be combined with the data for Class C design to complete device impedance data.
